THE ROLE OF LOCAL CURRENCY GOVERNMENT BONDS IN PROMOTING SUSTAINABLE ECONOMIC GROWTH

Kholikov Khamidulla
PhD, Senior specialist, the Central Bank of the Republic of Uzbekistan
https://doi.org/10.5281/zenodo.17380358

Abstract. *Local currency government bonds have emerged as a key instrument for promoting sustainable economic growth, particularly in emerging and developing economies. By issuing debt in domestic currency, governments can mobilize long-term financing while reducing exchange rate vulnerabilities and enhancing monetary independence. This paper examines the role of local currency government bonds in supporting fiscal sustainability, developing capital markets, and fostering economic stability. It discusses their benefits, challenges, and policy implications, emphasizing the importance of effective public debt management and market infrastructure. The study also draws on international experiences to provide insights for developing economies, with a specific focus on Uzbekistan's progress in building a resilient domestic government securities market as part of its ongoing fiscal and financial reforms.*

Key words: *local currency government bonds, public debt management, capital market development, economic growth, fiscal sustainability, monetary stability, emerging economies.*

INTRODUCTION

The development of the local currency government bond market represents both a key indicator of financial system maturity and a catalyst for sustainable economic growth. In modern economies, the issuance of government securities denominated in domestic currency serves as a cornerstone for financing infrastructure projects, managing public debt, and supporting macroeconomic stability. Unlike external borrowing, local currency bonds allow governments to raise funds without exposing themselves to exchange rate volatility, thereby enhancing fiscal resilience and monetary independence. Through these instruments, states can channel domestic savings into productive investments, foster capital market development, and create a reliable benchmark for corporate debt issuance.

In developing countries, including Uzbekistan, local currency government bonds play a particularly important role in addressing the dual challenge of financing development needs while maintaining debt sustainability. Rapid urbanization, infrastructure deficits, and the need to stimulate private sector growth require significant long-term financing, which cannot be solely met through budgetary resources or foreign borrowing. Expanding the domestic bond market provides an effective and transparent mechanism for mobilizing internal resources, strengthening financial intermediation, and improving the efficiency of public investment.

Furthermore, a well-functioning local currency bond market contributes to the deepening of the financial sector, enhances monetary policy transmission, and supports the creation of a stable yield curve essential for pricing other financial instruments. For Uzbekistan, the continued development of this market aligns with broader objectives of economic diversification, fiscal discipline, and sustainable growth. Establishing a robust institutional, legal, and regulatory

framework for local currency government bonds is therefore a strategic priority to ensure the country's long-term financial stability and development prospects.

LITERATURE REVIEW

The development of local currency government bond markets has been widely recognized as a key component of financial sector deepening and sustainable economic growth. According to Togo (2007), domestic government securities markets help reduce reliance on foreign currency borrowing, mitigate exchange rate risks, and provide a foundation for efficient public debt management. Bonds denominated in local currency enable governments to mobilize long-term financing domestically, creating a stable funding base for infrastructure and development projects. [1]

Allen, Carletti, and Gu (2014) emphasize that local currency bond markets contribute to financial stability by expanding investment opportunities for domestic institutional investors such as pension funds and insurance companies. These investors prefer assets denominated in local currency due to reduced currency risk and predictable returns. Moreover, the existence of a reliable government bond yield curve serves as a benchmark for pricing corporate bonds, enhancing overall capital market efficiency. [2]

From a macroeconomic perspective, Burger and Warnock (2006) argue that well-developed local currency bond markets lower the vulnerability of emerging economies to external shocks. When countries rely heavily on foreign currency borrowing, sudden depreciations can increase the real burden of debt and trigger financial crises. Conversely, local currency borrowing allows governments to align debt servicing with domestic revenue streams, strengthening fiscal sustainability. [3]

Claessens, Klingebiel, and Schmukler (2007) note that the growth of domestic bond markets depends on several structural factors, including sound macroeconomic policies, transparent fiscal management, an effective legal framework, and credible monetary policy. These elements build investor confidence and reduce risk premiums. They also highlight those institutional reforms – such as improving market infrastructure, disclosure standards, and secondary market liquidity – are essential for developing vibrant local bond markets. [4]

Empirical studies also highlight the link between local currency bonds and infrastructure financing. Sachs et al. (2019) show that infrastructure projects funded through domestic bond markets tend to have higher fiscal efficiency and accountability compared to those financed through external loans. Bonds provide a mechanism for spreading the cost of large projects over time while promoting transparency and market discipline. [5]

The Asian Development Bank (2020) underscores the importance of local currency bond markets in Asia's economic transformation. Many Asian economies – such as Malaysia, Thailand, and Indonesia – have successfully utilized domestic bonds to finance long-term infrastructure projects while minimizing exposure to currency mismatches. Their experiences demonstrate that a diversified investor base and active secondary markets are key to ensuring liquidity and sustainability. [6]

For developing economies like Uzbekistan, building a local currency government bond market can enhance fiscal resilience and foster economic development. According to IMF (2022), domestic debt markets not only provide alternative funding sources for governments but also support monetary policy transmission and financial inclusion. By mobilizing domestic savings and

offering safe investment instruments, they strengthen the overall stability and depth of the financial system. [7]

Although, the literature consistently identifies local currency government bonds as an essential instrument for promoting economic growth, financing infrastructure, and ensuring fiscal sustainability, their success depends on the establishment of sound macroeconomic fundamentals, transparent regulatory frameworks, and robust investor confidence. For countries like Uzbekistan, these lessons from international experience can guide the formulation of strategies aimed at developing an efficient and credible local currency bond market.

ANALYSIS AND RESULTS:

The global bond market, valued at over $135 trillion in outstanding debt as of 2024, serves as the backbone of long-term public and private financing. Within this vast system, local currency government bonds (LCGBs) play an increasingly important role in ensuring sustainable financing and financial stability. According to the International Monetary Fund and World Bank, the share of domestic bonds issued in local currency has grown significantly, particularly in emerging and developing economies, as countries aim to reduce dependence on foreign-currency borrowing and exposure to exchange rate fluctuations.

In advanced and emerging markets alike, LCGBs have become a primary tool for funding infrastructure, promoting fiscal resilience, and deepening domestic financial markets. For example, Malaysia, Thailand, and Chile have successfully leveraged local bond markets to finance major infrastructure projects such as highways, energy systems, and urban transportation. These countries demonstrate that developing a robust domestic bond market provides stable access to long-term financing while promoting investor confidence and macroeconomic stability.

Figure 1 below illustrates the key benefits of issuing government bonds in local currency for the issuer. Such bonds reduce foreign exchange risk, as debt servicing is done in domestic currency, and improve fiscal planning by aligning revenues and debt obligations in the same currency. They also strengthen monetary policy operations, offering a benchmark yield curve and a tool for open market actions.

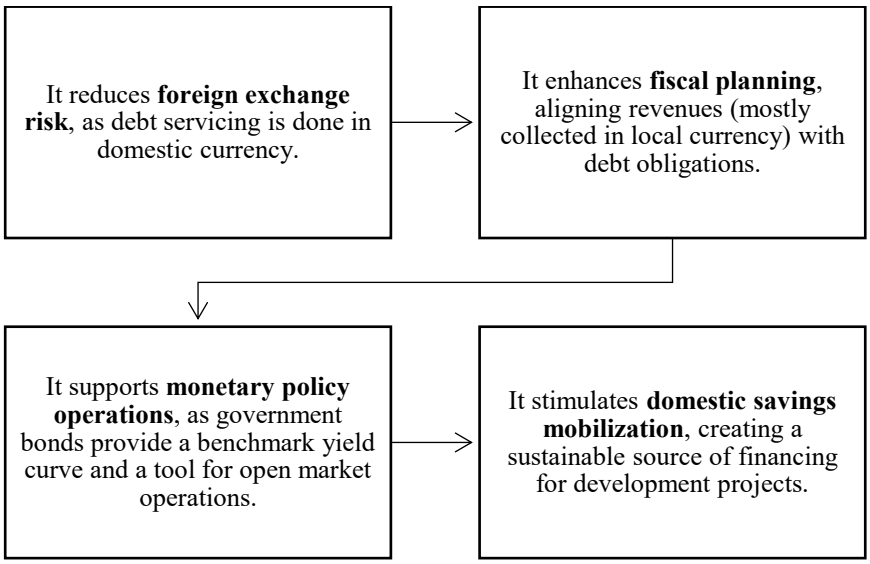

Figure 1. The benefits of issuing government bonds in local currency rather than in foreign currencies are substantial. For the issuer (government).

Source: The figure prepared by the author.

Moreover, they encourage domestic savings mobilization, providing a stable and sustainable source of financing for national development. For the issuer, these advantages collectively enhance fiscal stability, lower vulnerability to external shocks, and support sustainable economic growth.

The figure 2 below illustrates the mutually reinforcing relationship between the issuance of local currency government bonds and their benefits for both investors and the broader economy. These bonds represent a safe and stable investment vehicle, offering reliable returns and serving as an effective tool for portfolio diversification.

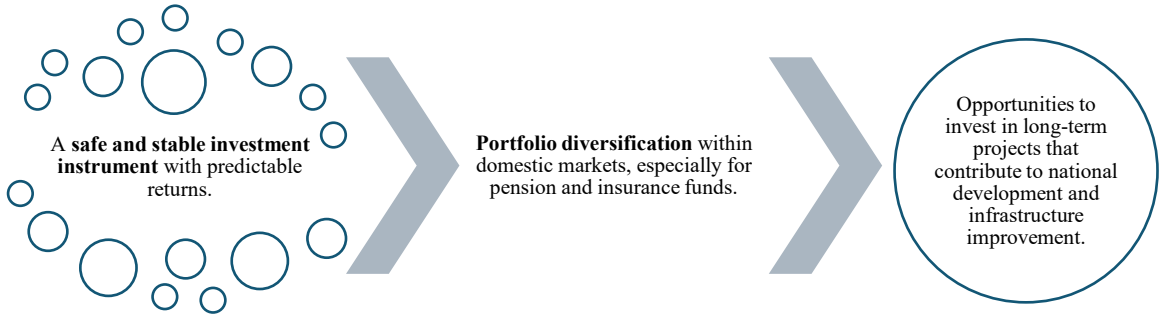

Figure 2. The benefits of issuing government bonds in local currency rather than in foreign currencies are substantial. For the investors.

They are particularly attractive to domestic institutional investors – such as pension funds and insurance companies – that seek long-term assets free from foreign exchange risk. Strong investor demand for these secure instruments enables the government to mobilize stable, long-term capital to finance national development and priority projects. In this way, local currency government bonds efficiently transform private demand for safety into sustainable public investment and economic growth.

The issuance of local currency government bonds in Uzbekistan serves multiple strategic purposes that contribute to the country's economic and financial development (Figure 3). These instruments provide a reliable source of funding for critical infrastructure projects such as transportation networks, water systems, and regional development initiatives. They also support more effective public debt management by reducing reliance on short-term external borrowing and promoting the use of longer-term domestic financing.

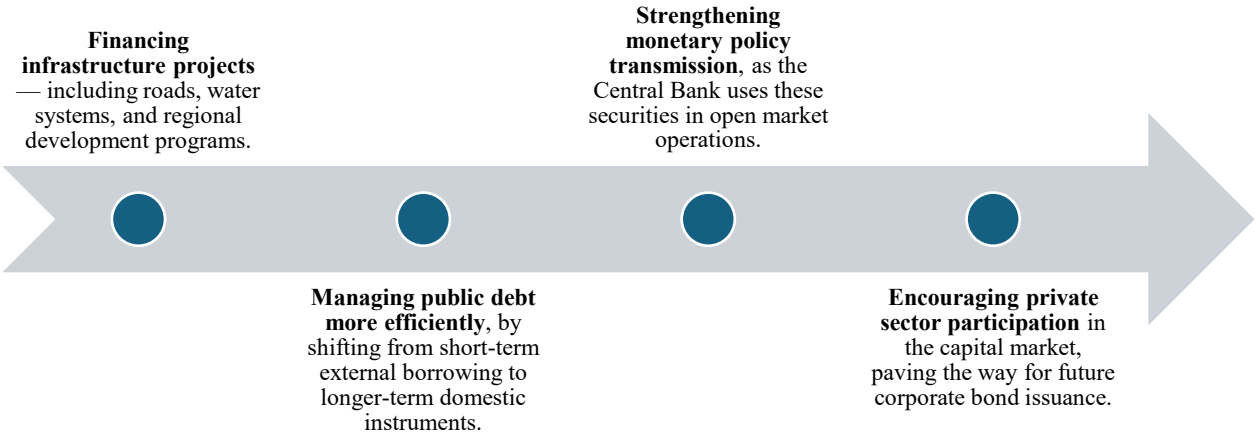

Figure 3. The issuance of local currency government bonds in Uzbekistan serves several strategic objectives.

Furthermore, local currency bonds enhance the transmission of monetary policy, as the Central Bank employs them in open market operations to regulate liquidity. Finally, the growing government bond market fosters greater private sector participation, laying the foundation for the expansion of corporate bond issuance and a more diversified capital market.

However, challenges remain. Limited investor diversification, a still-developing secondary market, and relatively low public awareness about government securities constrain the growth potential of the LCGB market. Furthermore, the need for improved transparency, credit rating mechanisms, and market infrastructure continues to be a policy priority.

International experiences demonstrate the path forward. For instance, Indonesia successfully developed a deep and liquid local bond market by broadening its investor base to include pension funds, insurance companies, and retail investors. India has used state government bonds (SDLs) to finance local development projects while maintaining fiscal discipline through market-based borrowing frameworks. These cases offer valuable lessons for Uzbekistan as it continues to expand its domestic bond market in line with fiscal decentralization and infrastructure investment goals.

The rapid expansion of Uzbekistan's domestic government securities market demonstrates the country's growing commitment to utilizing local currency bonds as a key instrument for financing economic growth and infrastructure development. Since 2018, the Ministry of Economy and Finance has steadily increased the issuance of Treasury Bonds (T-Bonds), signaling a strategic shift toward mobilizing internal financial resources rather than relying solely on external borrowing. In 2024, the total issuance of government securities reached 28.6 trillion UZS, marking a historic peak.

Currently, around 16% of Uzbekistan's total state debt is financed through domestic T-Bonds, indicating an enhanced capacity of the domestic financial market to absorb government debt and support fiscal sustainability. This growing reliance on local currency instruments reduces exposure to foreign exchange risks and strengthens macroeconomic stability, aligning with international best practices in public debt management.

Moreover, the Central Bank of Uzbekistan (CBU) has played a vital complementary role in developing the local bond market by issuing approximately 8 trillion UZS in short-term securities

to manage liquidity in the banking sector. These operations not only contribute to financial market stability but also deepen the local money market infrastructure, paving the way for a more active and diversified investor base. The continuous development of the domestic government securities market underscores Uzbekistan's progress in establishing a sustainable and market-based framework for public finance. By effectively leveraging local currency government bonds, the country is creating a more resilient fiscal system capable of financing infrastructure modernization, supporting regional economic growth, and promoting long-term financial independence.

In Figure 4 below analyses government securities issued and placed by the Ministry of Economy and Finance from December 2018 to September 2025. The total volume of issuance increased from 400 billion soums in 2018 to 33.16 trillion soums in 2025, representing a significant structural shift in the government's approach to financing economic growth and infrastructure development through domestic capital markets.

	2018	2019	2020	2021	2022	2023	2024	2025
Volume of issuance	400,0	1 550,0	5 290,0	7 700,0	15 860,0	21 250,0	42 211,7	33 160,0
Amount of placement	404,9	1 582,2	4 902,6	5 214,4	13 100,6	17 980,8	25 454,1	28 565,6
Volume of submitted orders	450,8	3 573,1	6 823,3	8 189,4	22 806,6	30 349,7	41 503,6	65 182,5
Growth rate compared to the previous year (placed GS in bln. soum)	0,00%	390,76%	309,86%	106,36%	251,24%	137,25%	141,56%	112,22%

Similarly, the amount of placement grew rapidly, reaching over 28.6 trillion soums in 2025, while the volume of submitted orders rose even faster, indicating growing investor interest and confidence in local currency debt instruments.

The data also highlight a consistent upward trajectory in the growth rate of government bond placements, with particularly sharp increases in 2019 (390.76%), 2020 (309.86%), and 2024 (141.56%). These figures demonstrate the government's active efforts to diversify its financing sources and strengthen fiscal autonomy through local borrowing rather than external debt. The trend underscores the increasing role of the domestic bond market as a key policy tool for mobilizing long-term resources to support infrastructure modernization, regional development, and social investment programs.

The expansion of the local currency bond market also reflects the success of recent fiscal and institutional reforms aimed at improving market infrastructure, enhancing transparency, and building investor confidence. The growing volume of submitted orders relative to the amount placed suggests a healthy demand–supply dynamic, which can contribute to more efficient pricing and liquidity in the domestic bond market. As investor participation broadens, the local government bond market becomes a more sustainable and predictable channel for financing national development priorities.

Furthermore, the consistent increase in bond issuance and placement signals an improvement in fiscal sustainability and macroeconomic stability. By prioritizing borrowing in local currency, Uzbekistan mitigates foreign exchange risks and reduces dependence on external debt markets. The growing participation of institutional and private investors – such as pension funds, insurance companies, and banks –demonstrates rising trust in fiscal management and in the government's commitment to transparency. As the domestic bond market deepens, it provides the state with a cost-effective and long-term financing mechanism to fund infrastructure, social programs, and innovation projects, directly contributing to economic growth and improved public welfare.

Overall, the dynamic development of Uzbekistan's local currency government bond market between 2018 and 2025 illustrates its growing importance as a strategic financial instrument. It not only strengthens public debt management and fiscal decentralization but also fosters the evolution of a more resilient, liquid, and diversified capital market – a cornerstone for sustainable economic development in Uzbekistan.

The shape and progression of the government securities yield curve reflect the emerging maturity of Uzbekistan's local currency bond market. It highlights the potential of these instruments to serve as a stable and efficient source of long-term financing for infrastructure development, while simultaneously deepening the domestic financial market. Strengthening this market further through regulatory reforms, investor diversification, and transparent debt management practices will enhance the effectiveness of local currency government bonds as a strategic tool for financing economic growth.

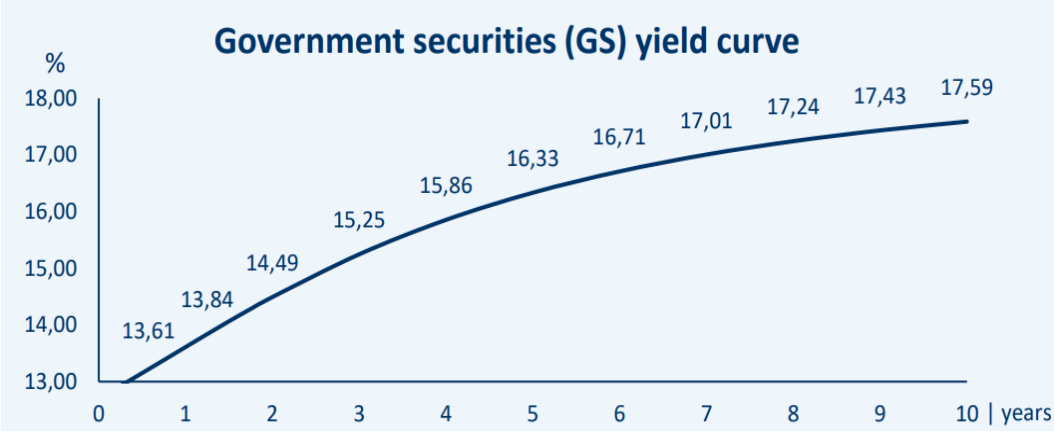

Figure 5. Government Securities (GS) Yield Curve of the Republic of Uzbekistan.

Source: The figure prepared by the author using data on the official website of the Central Bank of the Republic of Uzbekistan. https://cbu.uz/en/

The presented yield curve of government securities (GS) illustrates the relationship between bond yields (interest rates) and their maturities, ranging from 1 to 10 years. The curve

shows a positive and upward-sloping pattern, starting from approximately 13.61% for 1-year bonds and gradually increasing to 17.59% for 10-year bonds. This structure provides several important insights into the state of the local currency bond market and its implications for financing economic growth and infrastructure development (Figure 5).

Firstly, the upward slope of the yield curve indicates that investors demand higher returns for longer-term securities. This reflects both expectations of future inflation and perceived risk premiums associated with longer maturities. In developing economies such as Uzbekistan, this is a typical feature of a growing bond market, where investors seek compensation for uncertainties related to economic fluctuations, monetary policy changes, and credit risk. Nonetheless, the existence of a clear yield curve demonstrates that the local bond market is becoming more structured and transparent.

Secondly, the formation of a reliable yield curve is a critical element for pricing long-term investments and infrastructure projects. It serves as a benchmark for the cost of borrowing in the domestic currency and helps both the government and private sector determine the appropriate interest rates for project financing. In this sense, local currency government bonds not only serve as a financing tool but also establish the foundation for developing broader capital market instruments, such as corporate bonds and public-private partnership (PPP) financing mechanisms.

Thirdly, the observed yield levels (ranging from 13% to 17%) suggest that investor confidence in government securities is relatively stable, as yields rise moderately over time rather than sharply. This pattern indicates a growing trust in the government's fiscal and monetary policies, as well as in its ability to manage debt responsibly. Over time, as inflation stabilizes and macroeconomic conditions improve, the yield curve may flatten – signaling lower long-term risk and a more mature bond market.

Finally, the development of such a yield curve has broader macroeconomic significance. It enables the government to plan borrowing strategies efficiently, extend the average maturity of public debt, and reduce exposure to refinancing risks. Moreover, by promoting investment in local-currency-denominated instruments, it helps minimize dependence on external debt and exposure to exchange rate volatility – key goals for sustainable and independent economic development.

CONCLUSIONS:

The experience of various countries and the analysis of Uzbekistan's current practices show that local currency government bonds (LCGBs) represent one of the most effective instruments for sustainable economic development and fiscal resilience. By issuing government debt in domestic currency, the state not only secures stable long-term financing but also stimulates the growth of domestic capital markets and enhances investor confidence. In Uzbekistan, the gradual development of the local government securities market has already demonstrated several positive effects. Government bonds have become an important source of funding for infrastructure and regional development projects, supporting investments that might otherwise remain unrealized due to budgetary constraints. As the volume and diversity of bond issues expand, this process contributes to the modernization of transport, energy, and social infrastructure, which directly impacts economic growth and living standards. Moreover, the regular issuance and trading of local currency bonds promote financial discipline and transparency in public finance management. The requirements for disclosure, reporting, and credit assessment strengthen institutional capacity, improve fiscal planning, and encourage more responsible debt management practices. The use of LCGBs also fosters cooperation between the Ministry of Economy and Finance, the Central Bank,

and market participants, aligning monetary and fiscal policies through the development of a reliable domestic yield curve.

In the medium and long term, the expansion of the local government bond market will facilitate the mobilization of domestic savings, encourage the participation of institutional and retail investors, and enhance financial literacy within the population. This, in turn, will lay the foundation for the emergence of corporate bonds, municipal bonds, and other financial instruments, further diversifying Uzbekistan's capital market. As market infrastructure strengthens and investor confidence grows, the local bond market could gradually attract foreign institutional investors interested in stable, local-currency-denominated assets. This will not only deepen market liquidity but also integrate Uzbekistan more closely into the regional and global financial system.

In conclusion, local currency government bonds are a strategic tool for achieving balanced and sustainable economic development. For Uzbekistan, their further development requires continued reforms in debt management strategy, market transparency, investor diversification, and financial infrastructure. If effectively implemented, these measures will enable the domestic bond market to become a key pillar of fiscal stability, infrastructure modernization, and long-term economic growth.
