Abstract. *This article analyzes the economic essence of Results-Based Budgeting and the role and essence of Results-Based Budgeting in state budget expenditure management, as well as world experience.*

Keywords: *the strategic importance of public financial management through results-oriented budgeting.*

State policy and its implementation, including economic and social reforms and measures, are aimed at strengthening macroeconomic stability. Each country's development is aimed at improving the quality of life of the elderly population, and at further increasing the level of economic stability through the development of economic and social sectors. The macroeconomics is a type of economic theory that focuses on the specific sectors that are most affected by the current situation.

The state's ability to achieve economic growth is primarily due to its distributional instruments and the ability of the social system to achieve economic growth. The state is an integral part of the economic instruments of the state (money, credit, wages and salaries) and the institutions of the financial system. In fact, this is the role and place of the system of distributional relations of mutual cooperation. The public sector benefits the quality of the economy, it helps to organize the aspects of business and economic life.

Results-oriented budgeting (ROB) is a strategy for improving public spending. The main objectives of this approach are to allocate state resources in a way that is efficient and results-oriented, to increase the efficiency of state spending, and to ensure transparent and accountable state budgeting. In fact, one of the most effective tools for the strategy of reducing the cost of public services is quality control.

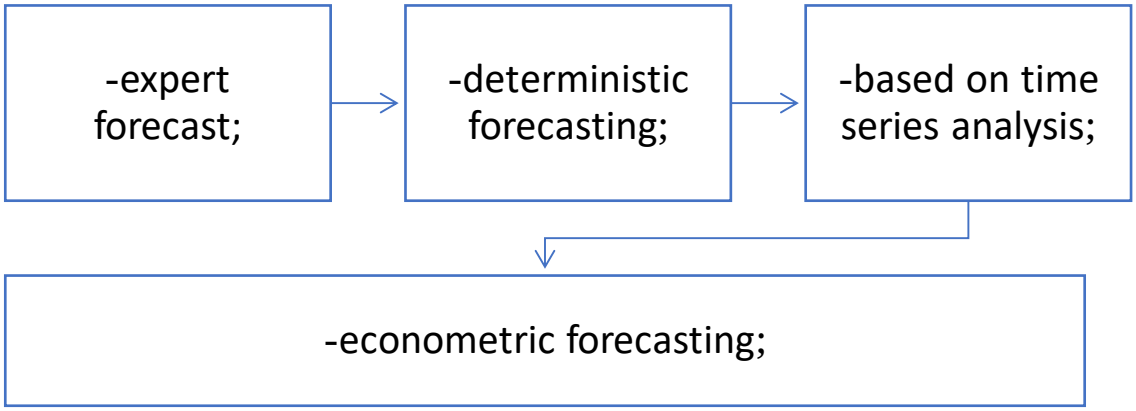
The strategy for improving public spending is a strategy that aims to optimize resource allocation, achieve specific results, and promote economic and social development. Through results-oriented spending, this strategy will focus on the following areas:

Target- and performance-based approach: Results-based budgeting is a method of planning based on clear and measurable goals. This creates a system of linking costs to results, so that each stage of the process does not produce the expected results and performance.

Each state is responsible for the implementation of the state's economic and social tasks, the redistribution of state resources, and the development of the country's infrastructure. The distribution and delivery of the benefits of the government to the people is carried out through the state-owned enterprise system.The main goal of the current study is to develop a practical approach to the problem of climate change. It is important to develop a practical approach to the problem of

climate change, which is aimed at improving the current situation of the country. It is important to emphasize that the process of achieving results is still a work in progress.

There are four main methods of medium-term forecasting of budgets and expenses:



These methods vary in complexity, the number of necessary steps, the time and resources required, and the effectiveness of identifying policy options for the proposed project. The key to identifying this or that method of forecasting is the ability to identify the underlying factors and their relationship to the heart.

Economic benefits of performance-based budgeting:

Performance-based budgeting is a method of allocating resources among departments in which expenditures are directed to specific departments. It is a way of ensuring that the budget system is waste-free and results-oriented. Results-oriented budgeting is a method of measuring the results of government spending on the basis of indicators. It is a tool for monitoring the effectiveness of a government's economic policy and ensuring that it achieves its goals. Results-based budgeting increases the transparency and efficiency of the public sector. It helps to improve the performance of public institutions, as well as to establish effective control over public spending and results.

The implementation of results-oriented budgeting is based on the following key elements:

Strategic Planning: A strategy for the main development goals and priorities of the state. It is a roadmap for the implementation of the results-oriented budgeting framework and the implementation of the results-oriented budgeting framework.

A series of pointers: Achieving goals is very clear and easy to follow. This will show you how to do it and what your monitor is doing.

Monitoring and research: The analysis of the results of the project and the results of the project and the preparation of reports on them. Based on these results, suggestions and corrections are made for the next phase of the project.

Result-oriented budgeting (ROB) is an effective and efficient way to reduce government spending. This approach ensures that public spending is clearly targeted to the elderly, and that it is transparent and proportionate, thereby contributing to economic development. In this regard, the impact of results-oriented budgeting on the state economy is to increase efficiency, increase efficiency, and ensure that the state budget system operates without waste.

The current and developing economic activities have highlighted the need to develop a system of economic development aimed at increasing the efficiency and effectiveness of the economy and achieving the desired results. The annual increase in government spending makes it difficult to reduce them from the point of view of economic growth.

It is the responsibility of the elders to understand the final outcome of such an economic crisis, focusing only on the positive behavior of the people affected by it. It is necessary to take into account the economic development of the country, the level of economic development, and the level of economic development. In fact, the final result of a nationally oriented economy is directly related to the level of state spending, their structural structure, and the direct, economical, and efficient use of state resources.Without a doubt, any actions taken by the state must be carefully prepared, deeply thought out, and based on solid evidence. The main basis of the state's work is to improve the state's quality of life, and the development of the state should be based on the principle of the highest quality of life. The most important aspect of budget planning is the proportion of expenditures spent on it.

There are a number of ways to make use of a jet engine. In particular, they include the following:

- It is difficult to determine the results of the services provided by the organization that is planning the future. The costs and savings of such a system make it difficult to maintain the quality of the results. Such a system, while not only does it aim to identify the efficiency of the system, it also creates the possibility of improving the efficiency of the system by showing the efficiency of the system, which only reflects the efficiency of the system.

- The third year of the state budget is a year of the year of the state budget, which is a year of the state budget, and a year of the state budget, which is a year of the state budget, In fact, long-term and personal financial policies are increasingly being implemented, which in turn necessitates their review and the introduction of appropriate changes.

- The long-term investment in the development of the country is a matter of research and development. The investment in the development of the country is a matter of research and development, and the cost of the development of the country is a matter of research and development. However, the launch of the equipment is expected to be in line with the country's forecast, and the country's parameters will be taken into account. The next step is to make decisions on the appointment of such workers, the identification of additional workers for the elderly, and the redistribution of the remaining workers. The difference between government spending and investment in the economy indicates that the state is focused on achieving its main goals, and it is also important to consider the economic and economic results of the planned investments.

The adoption of the Presidential Decree No. 311 of September 5, 2024 “On the Procedure for the Establishment of State Health Insurance Institutions” is of historical significance for the healthcare system. According to the decision, the creation of a health insurance system for the elderly, as a result of which the health insurance system is being implemented, is an integral part of the health insurance system, and the provision of health insurance services included in the insurance package is being implemented. It is recommended to consult a doctor or a health care professional for further information. Such a primary care physician shall examine the patient and refer it to the appropriate network of doctors for diagnostic standards, and if necessary, to hospitals, either electronically or by mail, or to the main network of doctors for examination and treatment, and to the hospital. The amount of the service fee will be paid to the person who complies with the established procedure.

The health insurance policy requires the patient to come to the hospital to receive the results of the medical examination. Depending on the results, the patient's family doctor will advise the patient on when and where to go for inpatient treatment. This is a single electronic

platform that allows medical practitioners to monitor the health of the population, maintain medical histories, write prescriptions for medications, and send them to the appropriate health facilities in a guaranteed package. This is a matter of great understanding between the government and the people of the region. Every citizen must be involved. This is why it is necessary to protect the elderly, their homes, and their homes. Thus, citizens can use the package delivery service wherever they go.The main benefit of these packages is that they are a key component of the health and early detection of diseases in the elderly population, who are already using the package.

Many of the most important developments in the last decade have been in the area of health promotion, which is a key element of the country's economic development. To review the main parameters of the average annual budget for the past fiscal year, to analyze changes in external factors and conditions, to assess the results of the implementation of health care facilities, The changes introduced into the main indicators of the previous year are based on the main indicators of the population, the exact types of diseases that have occurred, as well as the forecast for the next year, which will allow for adjustments to the indicators or their implementation.

Thus, the new year's resolution is a structural part of the middle-aged and elderly people's identity, which is renewed every year and continues to grow year after year. This is a clear indication of the purpose of the current policy, the succession of the state policy and the distribution of the benefits that are expected to be achieved, and the future policy clearly defines the priorities of the state policy and the conditions for achieving them. Enter the password. The strategy of economic and social development of the country, aimed at achieving the results of economic development, is a comprehensive system of measures and means that are planned and implemented in order to achieve the goals of economic development and the development of the country.
